## Disclaimers

The views expressed here are those of the authors and do not represent the views of Freddie Mac, its Board of Directors, the Federal Housing and Finance Administration (FHFA), the Urban Institute, its trustees, or its funders.

## Summary

- Finding: Among borrowers refinancing within the Home Affordable Refinance Program (HARP), a 10\% reduction in monthly payments leads to about a $10 \%-12 \%$ reduction in monthly default hazard
- Result holds when controlling for program participation based on observables
- Contributions:
- Extend literature on payment shocks and default from smaller market segments to mainstream fixed-rate 30-year mortgage market
- Controls for selection based on observables using novel approach from biostatistics literature

## Road Map

- HARP program description
- Literature review
- Data description and summary statistics
- Hazard model estimates
- 2-stage selection and hazard model estimates
- Wrap up

## Motivation

- What is HARP? From August 2013 FHFA Refinance Report (p. 1)*:
- "HARP was established in 2009 to assist homeowners unable to access a refinance due to a decline in their home value... The program is designed to provide these borrowers with an opportunity to refinance by permitting the transfer of existing mortgage insurance to their newly refinanced loan, or by allowing those without mortgage insurance on their previous loan to refinance without obtaining new coverage."
- As of August 2013, 2.89 million borrowers refinanced through HARP program with Fannie Mae and Freddie Mac
- Scheduled to expire December 31, 2015
- Many borrowers refinance into mortgage with lower rates, reducing their monthly principal \& interest (P\&I) payment
- Natural experiment to analyze the effect of this payment reduction on default
- Large population of conforming mortgages
- Material payment reductions
*http://www.fhfa.gov/webfiles/25620/August2013RefiReport.pdf

## HARP Program Requirements for Freddie Mac Borrowers

- Initial program requirements for "HARP 1" (June 2009 - December 2011)
- Estimated current LTV above 80\% and less than or equal to 125\%
- Current on payment history for prior 12 months
" Expansion to "HARP 2" relaxing requirements (January 2012 - present)
- No upper bound on current LTV (e.g. loans above 125\%)
- Current on payment history for prior 12 months or at most a single missed payment 7 to 12 months prior
- Subtle differences in eligibility for Fannie Mae

## Literature Review

- Zhu (2012) - HARP program treatment effect
- Payment reduction
- Fuster and Willen (2012)
- Tracy and Wright (2012)
- Pan and Schaubel (2008) - selection modeling in hazard context
- Mortgage Default
- Classic Option Theoretic View - Foster and van Order (1984), Kau, Keenan, and Kim (1994), Vandell (1995)
- Dual Trigger - Elmer and Seelig (1999), Elul et al (2010), Campbell and Cocco (2011)

## Data Description

- Random subsample of 508,758 Freddie Mac HARP refinances
- Traits of refinance mortgage and prior mortgage
- Performance of refinance mortgage following refinance (7.02 million loanmonths)
- Average performance history of HARP 1 loan is 32 months and 10 months for HARP 2
- Restrictions
- Borrowers refinancing from fixed-rate 30-year mortgages to fixed-rate 30year mortgages to rule out selection issues related to product and term
- Experience reductions in monthly P\&I payment
- Macroeconomic controls
- BLS County-level unemployment
- Local house price trends measured by zip-level Freddie Mac Weighted Repeat Sales Index (WRSI)

## HARP 1 Summary Statistics

| above 750 | $0.2 \%$ | $110 \%-125 \%$ | $0.6 \%$ | above $20 \%$ | $0.3 \%$ |

Table 2c: HARP 2 (LTV > 125\%) Average Ever D90+ Rates

| Post FICO | Average <br> D90+ Rate | Payment <br> Reduction | Average <br> D90+ Rate |
| :---: | :---: | :---: | :---: |
| below 650 | $1.7 \%$ | $0-10 \%$ | $1.3 \%$ |
| $650-700$ | $1.2 \%$ | $10 \%-15 \%$ | $1.4 \%$ |
| $701-750$ | $1.0 \%$ | $15 \%-20 \%$ | $1.4 \%$ |
| above 750 | $0.7 \%$ | above 20\% | $0.9 \%$ |

## KS Failure Plots Show Strong Effect of Payment Reduction on Default

Figure 2: HARP 1: Kaplan-Meier Failure Estimates by Payment Reduction

- Analysis of KM failure estimates at 46 month horizon suggest a $7.5 \%$ reduction in payment leads to about a $7.8 \%$ reduction in cumulative default rate
- Scales to $10 \%$ reduction in default leads to $10.4 \%$ reduction in cumulative default

## Hazard Model Approach: Cox Relative Risk Model with Time-Varying Covariates

- Instantaneous probability of default described by a hazard function

$$
h(t)=\lim _{\tau \rightarrow 0} \frac{P(t \leq T<t+\tau \mid T \geq t)}{\tau}
$$

- Hazard function modeled as

$$
h\left(t ; x_{i t}\right)=h_{0}(t) \exp \left[\beta^{\prime} x_{i t}\right]
$$

- $x_{i t}$ is a vector of (possibly time-varying) covariates
- Static traits of refinance mortgage and prior mortgage
- Time-varying covariates: Current LTV following refinance, BLS unemployment rate, house price growth rate in prior 2 years
- $h_{0}(t)$ is an arbitrary baseline hazard function
- Default is defined as the first time a loan becomes more than three months' delinquent (abbreviated D90+)

## Hazard Model Estimates: Basic Specification

Table 3: Hazard Model Regression Results (Hazard Ratios)

|  | HARP 1 |  | HARP 2 (LTV $125 \%)$ | HARP 2 (LTV > 125\%) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Payment Reduction*10 (\%) | $0.898^{* *}$ | $0.902^{* *}$ | $0.818^{* * *}$ | $0.823^{* * * *}$ | $0.776^{* * *}$ | $0.779^{* * *}$ |
| Post LTV | $0.985^{* * *}$ | $0.98^{* * *}$ | 0.992 | 0.991 | $1.022^{* * *}$ | $1.022^{* * *}$ |
| Delta LTV | 0.999 | 0.999 | 1 | 1 | $0.981^{* * *}$ | $0.981^{* * *}$ |
| Post FICO | $0.991^{* * *}$ | $0.991^{* * *}$ | $0.989^{* * *}$ | $0.989^{* * *}$ | $0.994^{* * *}$ | $0.994^{* * *}$ |
| Delta FICO | 1.001 | 1.001 | 1 | 1 | 1 | 1 |
| CLTV | $1.038^{* * *}$ | $1.042^{* * * *}$ | $1.034^{* * *}$ | $1.035^{* * *}$ | $1.003^{*}$ | $1.003^{*}$ |
| 2-Year HPA | $0.271^{* *}$ | $0.314^{*}$ | $0.002^{* * *}$ | $0.002^{* * *}$ | $0.04^{* * *}$ | $0.049^{* * *}$ |
| Unemployment Rate | 1.003 | 1.004 | 1.01 | 1.009 | $1.025^{*}$ | 1.025 |
| State Fixed Effects (FE) or Strata | FE | Strata | FE | Strata | FE | Strata |
| Vintage Fixed Effects (FE) or Strata | FE | Strata | FE | Strata | FE | Strata |
| -2 Log L (Intercept Only) | 52,808 | 37,579 | 34,131 | 27,417 | 22,052 | 17,455 |
| -2 Log L (Int + Covariates) | 51,412 | 36,326 | 32,932 | 26,323 | 21,788 | 17,212 |

- Hazard ratio is $e^{\widehat{\beta}}$
- Interpretation for continuous variable: hazard ratio - 1 = semi-elasticity
- E.g. in Model (1), $10 \%$ reduction in payment corresponds to $10.2 \%$ reduction in monthly default hazard

## Limited Evidence of Interaction Between Payment Reduction and LTV, FICO

- Interaction interpretation: Product of hazard ratios
- E.g. equation (3): if LTV = 1.0 (e.g.100\%), then hazard ratio of payment reduction effect is $2.387^{*}\left(0.357^{1.0}\right)=0.85$

Table 4: Hazard Model Regression Results (Hazard Ratios)

|  | HARP 1 |  | HARP 2 (LTV 125\%) |  | HARP 2 (LTV > 125\%) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | (1) | (2) | (3) | (4) | (5) | (6) |

## Selection Model Detail and Motivation

- Issue: What if observed effect of payment reduction on default is biased by which borrowers select to participate in HARP program?
- Solution: Inverse Probability Weighting
- Construct sample of HARP and eligible non-HARP loans
- 743,725 non-HARP loans and 508,758 HARP loans
- First stage: Logistic model with dependent variable of HARP participation
- Second stage: Re-estimate hazard model weighting observations by inverse of estimated probability of HARP participation from first tage-model
- Pan and Schaubel (2008) show such an approach leads to unbiased estimation in context of Cox hazard model under certain conditions

## Selection Model Estimates of HARP Participation: UPB, Servicer Key Drivers

## Quantitatively Similar Estimates of Payment Reduction Effect as Other Authors

- Fuster and Willen (2012): Cutting payment in half reduces default hazard by about two thirds
- Examine interest-only (IO) mortgages
- Tracy and Wright (2012): 10\% payment reduction leads to 22.5\% reduction in monthly default hazard for borrowers with CLTV above 80\%
- Sample: Downward resets for adjustable rate mortgages (ARMs)
- Observe relatively small magnitudes of payment change relative to HARP

## Conclusion

- Finding: 10\% reduction in monthly payments leads to about a 10\%$12 \%$ reduction in monthly default hazard
- Result holds when controlling for selection based on observables
- Contributions:
- Extends other research on smaller market segments to mainstream fixed-rate 30-year mortgage market
- Controls for selection based on observables using novel approach from biostatistics literature
