

Using Stock Returns to Identify Shocks to Government Spending

Jonas D.M. Fisher Ryan Peters
Chicago Fed

Atlanta Fed Fiscal Policy Conference, January 8-9, 2010

Motivation

- What is the G multiplier?
- Use response to G shocks to test models
- Two approaches lead to different answers
 - VAR innovations to G , Blanchard and Perotti (2002):
 $G \uparrow \Rightarrow Y, H, C, W/P \uparrow$
 - Historical narrative, Ramey and Shapiro (1998):
 $G \uparrow \Rightarrow Y, H \uparrow C, W/P \downarrow$

- Drawbacks to both approaches
 - VAR innovations: Ramey (2008) critique
 - Narrative strategy: few observations, all increases, assume certainty, inherently subjective
- Seek alternative immune to Ramey critique, with more observations, increases and decreases, incorporating uncertainty, less subjective
- Uhlig and Mountford (2005): sign restriction approach satisfies these criteria

Alternative Approach

- Low frequency swings in military spending: Korean War, Vietnam War, Carter-Reagan Buildup, End of Cold War, 9/11 [spending]
- Anticipated military build ups should be reflected in stock returns of military contractors
- Explore using innovations in excess returns of military contractors to identify spending shocks
- Key findings:
 - Multiplier = 1.5
 - $G \uparrow \Rightarrow Y, H, C \uparrow W/P \downarrow$ then \uparrow

Outline

- Model
- Describe data
- Identification strategy
- Findings

Model: Preferences and Technology

$$\max \sum \beta^t (\ln c_t - n_{ct} - n_{mt})$$

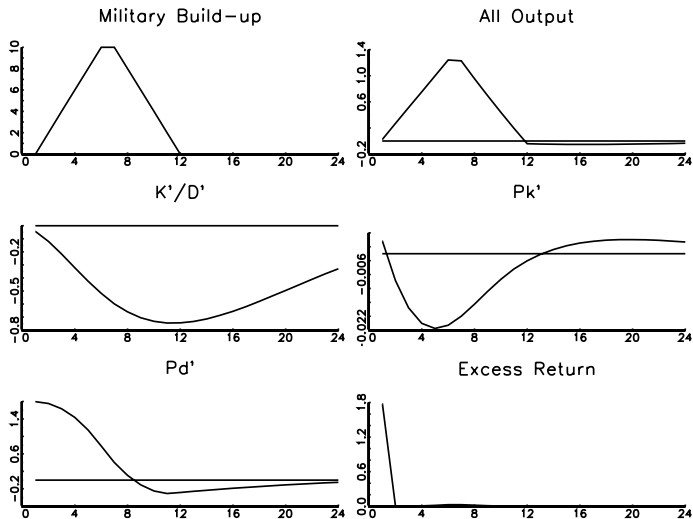

$$c_t + x_{ct}/q_t + x_{mt}/q_t + g_t \leq A_t k_t^\alpha n_{ct}^{1-\alpha}$$

$$m_t + \bar{m} \leq A_t q_t d_t^\alpha n_{mt}^{1-\alpha}$$

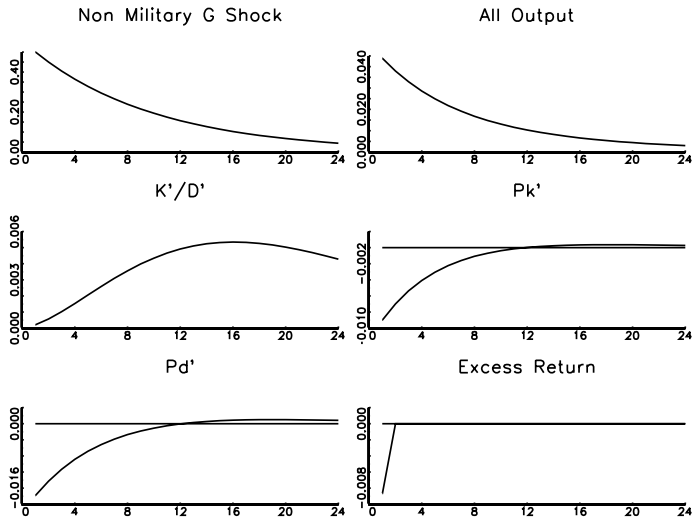

$$k_{t+1} = (1 - \delta)k_t + g(x_{ct}, x_{ct-1})$$

$$d_{t+1} = (1 - \delta)d_t + h(x_{mt}, x_{mt-1})$$

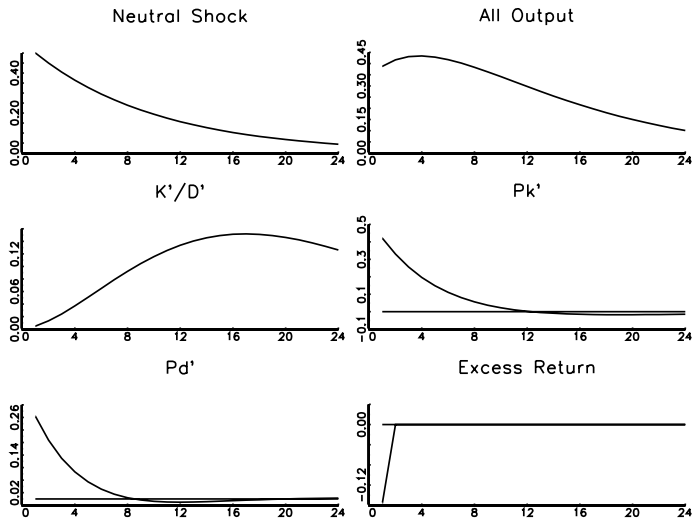

Model: Responses to Military Shock

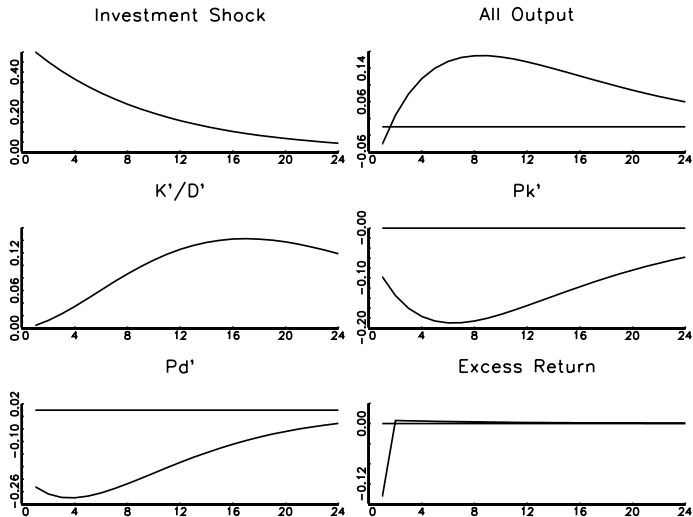

Model: Responses to G Shock

Model: Responses to Neutral Technology Shock

Model: Responses to Investment Technology Shock

Responses Estimated from *Model* Generated Data

- Top 3 Primary Munitions Contractors 1957-2007
- Guns+: Include by SIC/NAICS code
 - Ordnance and Accessories
 - Ship & Boat Building & Repairing
 - Guided Missiles & Space Vehicles & Parts
 - Aircraft & Parts & Auxiliary Equipment, NEC
 - Tanks and Tank Components
 - Search, Detection, Navigation, Guidance, Aeronautical Systems
- Guns: Guns+ less last two (Fama-French/Lustig, et al)
- War Dates (Ramey-Shapiro/Eichenbaum-Fisher)
- War Dates+ (Ramey)

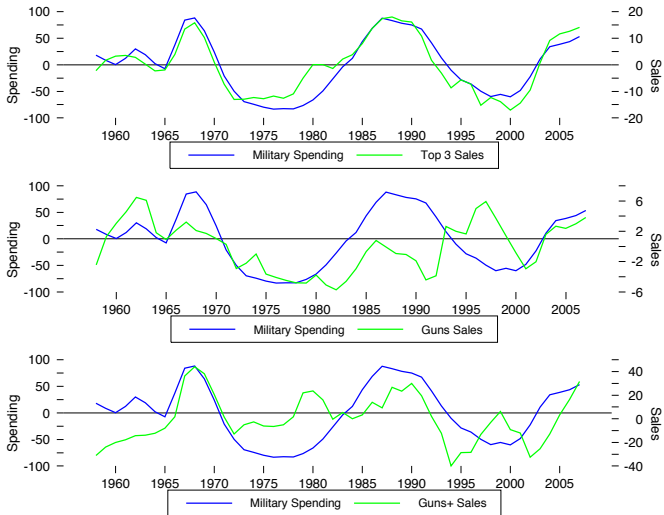

Top 3 US Military Contractors

Primary Contractor	SIC Industry	Years in Top 3
General Dynamics	Ship and Boat Building, Repairing	1958-1962, 1965-1971, 1974-1974, 1978-1992
Grumman	Aircraft	1970-1972
Lockheed Aircraft, Lockheed (1977-1994), Lockheed Martin (1995-)	Guided Missiles, Space Vehicle, Parts	1958-1977, 1983-1987, 1992-2007
Martin, Martin Marietta (1961-1993)	Guided Missiles, Space Vehicle, Parts	1959-1962, 1993
McDonnell Aircraft, McDonnell Douglas (1966-1996)	Aircraft	1963-1964, 1966, 1968-1969, 1971-1996
Northrop, Northrop Grumman (1994-)	Search, Detection, Navigation, Guidance, Aeronautical Systems	1975, 1992, 1994-2007
Raytheon	Search, Detection, Navigation, Guidance Aeronautical Systems	1988-1991, 1996, 1998-2000
United Aircraft, United Technologies (1969-)	Aircraft, Parts	1958, 1966-1968, 1975-1982

Top 3 Share of Primary Contracts

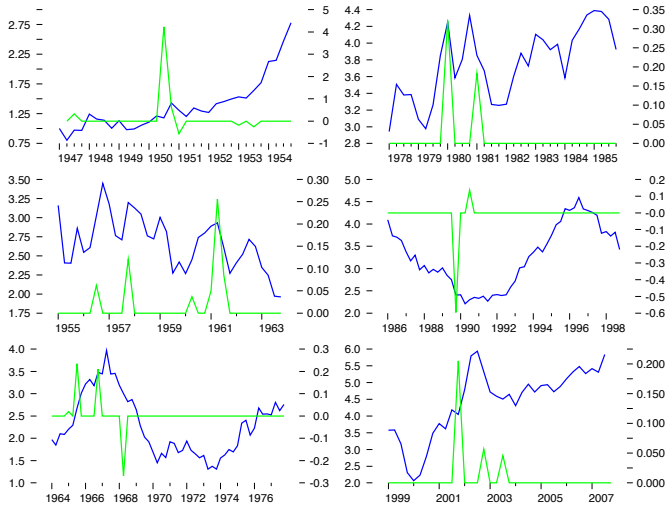

Detrended Sales and Military Spending

Accumulated Excess Returns and Military Spending

Excess Returns and Ramey (2008)'s Shocks

Explanatory Power of Spending Indicators

Variable	Top 3	Guns	Guns+	War Dates	War Dates+
				1948:1–2007:4	
Military Spending	.07	.05	.06	.26	.58
Government Spending	.08	.02	.03	.24	.56
Output	.03	.03	.03	.08	.07
Consumption	.05	.06	.06	.08	.12
				1957:3–2007:4	
Military Spending	.21	.07	.17	.06	.09
Government Spending	.11	.04	.11	.02	.06
Output	.08	.06	.06	.09	.03
Consumption	.05	.06	.05	.09	.03

Note: The reported R^2 's are based on regressions of the predicted variable on the current value and six lags of the indicator variable. Variables are log first differences

Identification Strategy

- S = accumulated excess returns
- VAR: $MilG, Y, R, X, S, X = G, C, H, W/P$
- G-shock: Choleski innovation in S , S ordered last
- If represent economy well, good estimate of G- shock when
 - Tech change in Top 3 as in whole economy
 - Markup dynamics as in whole economy
 - Variation in sales dominated by shocks to defense spending

Excluding Korean War

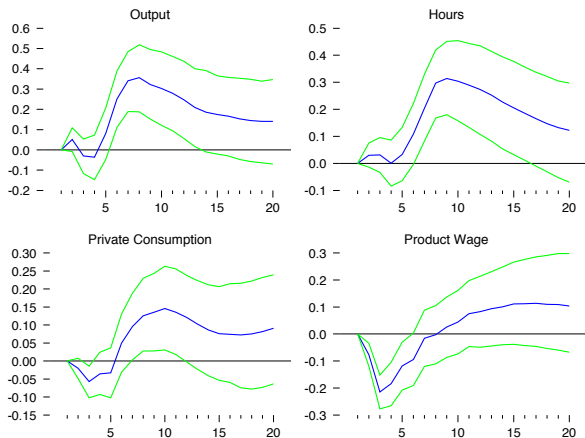

- 1959:1-2006:4, trend, six lags
 - Returns poor forecast of Korean War build up
 - Excess Profits Tax, *W & P* controls
- Eisenhower Farewell Address:

Our military organization today bears little relation to that known by any of my predecessors in peacetime, or indeed by the fighting men of World War II or Korea. Until the latest of our world conflicts, the United States had no armaments industry. American makers of plowshares could, with time and as required, make swords as well. But now we can no longer risk emergency improvisation of national defense; we have been compelled to create a permanent armaments industry of vast proportions.

Effects of Top 3 Excess Return Shocks

Effects of Top 3 Excess Return Shocks

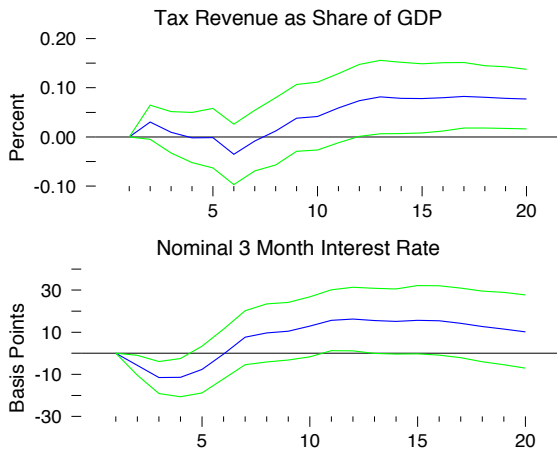

[Other Variables]

Government Spending Multiplier

- 20 quarter accumulated G response: 0.10
- 20 quarter accumulated Y response: 0.03
- $G/Y = 0.2$
- $\frac{dY}{dG} = (0.03/0.10) \times (1/0.20) = 1.5$
- Is this all G ?: $\frac{dY}{dG} + \frac{dY}{dP} \frac{dP}{dG}$

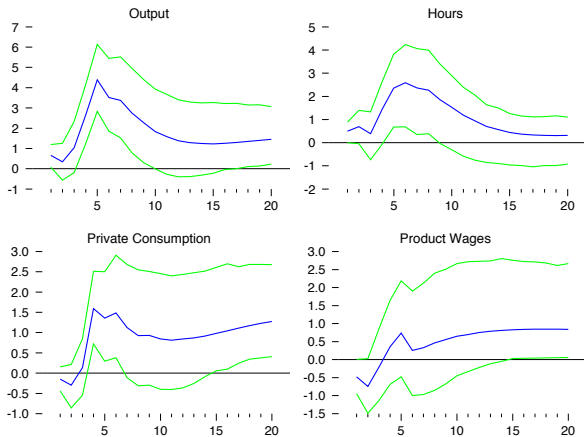

Responses of Policy Variables

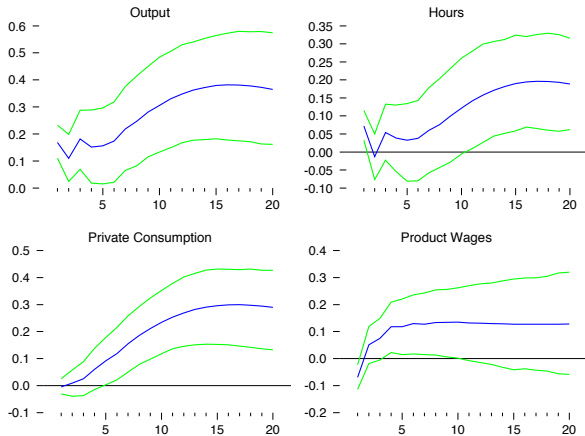

Historical Effects of Shocks

Effects of War Dates

Effects of Using Spending Innovations

Conclusion

- Anticipated military build ups should be reflected in stock returns of military contractors
- Explore using innovations in excess returns of Top 3 primary military contractors to identify spending shocks
- Multiplier = 1.5
- $G \uparrow \Rightarrow Y, H, C \uparrow W/P \downarrow$ then \uparrow

US Military Spending, 1947-2008

Model: Shocks

$$\begin{bmatrix} a_t \\ g_t \\ q_t \\ m_t \\ s_t \\ s_{t-1} \\ s_{t-2} \end{bmatrix} = \begin{bmatrix} \rho_a & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & \rho_g & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & \rho_q & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & b_1 & b_2 & b_3 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} a_{t-1} \\ g_{t-1} \\ q_{t-1} \\ m_{t-1} \\ s_{t-1} \\ s_{t-2} \\ s_{t-3} \end{bmatrix} + \begin{bmatrix} \varepsilon_t \\ \eta_t \\ \nu_t \\ 0 \\ \mu_t \\ 0 \\ 0 \end{bmatrix}$$

Effects of Excess Return Shocks
