Sturm und Drang in Money Market Funds When Money Market Funds Cease to Be Narrow

Stephan Jank & Michael Wedow

(University of Tübingen & Deutsche Bundesbank & European Central Bank)

Atlanta, Financial Markets Conference

Atlanta, April 10 2012

The presentation represents the authors' personal opinion and not necessarily those of the Deutsche Bundesbank or the ECB.

◆□▶ ◆御▶ ◆臣▶ ◆臣▶ ―臣 …の�?

"Money market funds are boring, but safe."

(Morningstar.de 08/16/2002)

Jank & Wedow (2012)

Sturm und Drang in Money Market Funds

April 10 2012 2 / 27

・ロン ・回 と ・ ヨン・

Similarity of Banks and Mutual Funds:

- Withdrawals are costly (liquidity-based trading).
- It takes time to restore cash balance \rightarrow remaining investors bear most of the costs. \rightarrow negative externality.

Edelen(1996), JFE; Nanda, Narayanan & Warther(2000), JFE

- The negative externality increases if assets are less liquid.
- Expectation that other investors will withdraw \rightarrow "self-fulfilling run" Diamond & Dybvig (1983), JPE

Mutual funds give us a setting to test hypotheses about strategic complementarities.

e.g. Goldstein & Pauzner (2005), JF; Chen, Goldstein and Jiang (2007)

Motivation: Why are Money Market Funds Interesting?

- Maturity intermediation <u>bank runs</u>
- Solution: deposit insurance
- Deposit insurance $\longrightarrow \underline{\text{moral hazard}}$
- Solution to the dilemma: reduction of maturity gap \longrightarrow "narrow banking"
- Money market funds (short-term, high-grade debt) pprox narrow banks

Are money market funds immune to market-wide liquidity shocks?

Run

A drop in market-wide liquidity leads to outflows.

Safe Haven

A drop in market-wide liquidity results in inflows.

イロト イヨト イヨト イヨ

• Studies using aggregate US data support the "safe haven" hypothesis. Gorton & Pennacchi (1992); Miles (2001), JEF; Pennacchi (2006), JME;

Motivation: Excess Return of German Money Market Funds

Figure: MMFs' Excess Return

April 10 2012 5 / 27

< □ > < 🗗 > < 🖹

United States

- Introduction in the 70s
- Total assets: 3,107.1 billion USD
- 25.8 % of mutual fund assets ICI Factbook (End of 2007)
- Maximum maturity: 1 year
- Weighted average maturity: 90 days (SEC)
- Implicit insurance of issuer "never break the buck"
- Constant NAV

Germany

- Introduction in the mid 90s
- Total assets: 26.8 billion EUR
- 7.6 % of mutual fund assets Deutsche Bundesbank (End of 2007)
- Maximum maturity: 1 year (85 % of assets) InvG
- Weighted average maturity: no restriction

<ロト </p>

- No implicit insurance
- Floating NAV

Sample

- Survivorship-bias-free sample of all German retail money market funds
- Number of funds: 49
- Sample period: 1996/01 2008/06 (1999/01 2008/06)
- Assets: Euro denominated assets

- Who are the winning funds and do they repeat?
- Performance persistence of MMFs is usually very high.
- First-order autocorrelation of annual excess return: 0.54
- Now: a detailed view.

		Repeat Winners and Losers			Od	ds Ratio		
Year	Total	Winner-	Winner-	Loser-	Loser-	Odds-Ratio	z	p-value
		Winner	Loser	Winner	Loser			
1996	24							
1997	30	6	6	6	6	1.0	0.00	1.000
1998	31	8	7	6	9	1.7	0.73	0.466
1999	30	10	3	5	11	7.3	2.34	0.019
2000	30	12	3	3	12	16.0	3.04	0.002
2001	33	7	8	7	8	1.0	0.00	1.000
2002	36	9	5	5	11	4.0	1.77	0.076
2003	35	12	6	5	12	4.8	2.15	0.032
2004	37	13	4	4	13	10.6	2.92	0.004
2005	37	13	5	5	14	7.3	2.68	0.007
2006	37	16	2	2	17	68.0	3.98	0.000
2007	34	7	10	10	7	0.5	-1.02	0.306
Pearson's p_{λ} Test:								
λ :		76.2						
p-value	:	0.000						

- Overall: persistence in performance
- Years without persistence and reversals also occur : Most winners in 2006 (high liquidity) are losers in 2007 (low liquidity)

The Determinants of Money Market Funds' Returns

Determinants of MMFs' Returns:

• Expense ratio (commodity view)

Domian & Reichenstein (1998), FSR; Christoffersen & Musto (2002), RFS

Riskiness of portfolio

Koppenhaver(1999), FRB Chicago Proceedings

Asset Pricing Theory:

Illiquid assets outperform in liquid times and underperform in illiquid times.

Acharya & Pedersen (2005), JFE

Hypothesis 1:

Funds that hold illiquid assets outperform in liquid times and underperform in illiquid times.

Massa & Phialippou (2005)

イロト イ団ト イヨト イヨト

Monthly Cross Sectional Regressions:

Excess $Return_{it} = \beta_0 + \beta_1 Liq$. Assets_{i,t-1} + $\beta_2 Size_{i,t-1} + \beta_3 Expense Ratio_i + \varepsilon_{i,t}$

Excess Return _{it}	Money market funds' return minus Bubill rate
Liq. Assets _{i,t-1}	Share of government securities, bank deposits and commer-
	cial papers
Expense Ratio _i	Annual expenses/ average assets (fund average)
Size _{i,t-1}	Log of total assets (EUR)

Hypothesis 1:

Funds that hold illiquid assets outperform in liquid times and underperform in illiquid times.

*** p< 0.01, ** p< 0.05, * p< 0.10

• Funds that hold illiquid assets outperform in liquid times and underperform in illiquid times.

- Money market funds are **not** a commodity.
- Fund managers are able to offset expenses and **enhance returns** by investing in **less liquid assets**.
- Illiquid funds outperform liquid funds in liquid times.
- Long period of high liquidity (2001-2006) \rightarrow illiquid funds outperform persistently.

- Enhancing returns widens the narrow structure of money market funds and makes them vulnerable to runs.
- How does an illiquidity shock influence money market funds' flows?

(ロ) (回) (三) (三)

- Withdrawals are costly (liquidity-based trading).
- Time to restore cash balance \rightarrow remaining investors bear most of the costs. \rightarrow negative externality
- The negative externality increases if assets are less liquid.
- Expectation that other investors will withdraw. \rightarrow "self-fulfilling run"

Hypothesis 2:

In illiquid times funds that hold illiquid assets are more likely to experience a run than funds that hold liquid assets.

Net Flows by Portfolio Liquidity (2007/07 - 2008/06)

- Significant performance-flow relationship.
- Flows following an illiquidity shock differ across liquid and illiquid funds.

Marginal Effect of Market Illiquidity on Net Flows

A market illiquidity shock leads to ...

- significant outflows, if the share of liquid assets is small (Run)
- no significant outflows, if the share of liquid assets is large enough (Safe Haven)

- Fund managers have an incentive to enhance their returns.
- Illiquid funds outperform liquid funds as long as market-wide liquidity is high.
- Investing in less liquid assets widens the narrow structure of money market funds.
- Investors react to good and bad performance of money market funds.
- Following an illiquidity shock we observe runs on illiquid/enhanced funds.

- CESR guidelines on a common definition of European money market funds (May 2010).
- Two tiered approach with objective of investor protection
- Distinction through very short and longer weighted average maturity
- Short Term MMF
 - Only investments in highest quality assets: two highest available short-term credit ratings.
 - Ensure its portfolio has a weighted average maturity (WAM) of no more than 60 days.
 - Ensure its portfolio has a weighted average life (WAL) of no more than 120 days.
 - Residual maturity until the legal redemption date of less than or equal to 397 days.
 - Constant or a fluctuating net asset value
- Longer Term MMF
 - Only Fluctuating NAV
 - May invest in sovereign issuance of at least investment grade quality.
 - Residual maturity until the legal redemption date of less than or equal to 2 years.
 - Weighted average maturity (WAM) of no more than 6 months.
 - Weighted average life (WAL) of no more than 12 months.
